Compiling Your Android Application

v1.0

By GoNorthWest

30 November 2011

So, you read my other document, *Setting Up Your Android Development Environment*, and now you want to compile and run that super cool Android app you created on Buzztouch. Fair enough! You've done the hard part up to now...the rest is pretty easy once you understand how things work. This document will show you two different ways to get your app running in the Android emulator you set up previously and ultimately on a device!

Scroll down to the next page to start with Method 1 : Import Your Project. I haven't quite worked out all the formatting issues yet.

Yeah...next page...it's there..really!

Have fun!

Here's a picture I took this summer to keep you entertained until the next page.

Method One: Import Your Project

When you download your Android code package from Buzztouch, you're essentially getting a complete project. All the files you need are contained in the zipped folder you get. So, importing your project into Eclipse is as easy as specifying the folder location, proving a bit of info, and hitting OK! Let's get started!

- 1. **Start Eclipse**. Start Eclipse by either double-clicking on the icon you set up for it somewhere, or double-clicking on the eclipse.exe file that is found In your installation path. For me, it's at c:\eclipse\eclipse.exe.
- 2. Import Your Project.
 - a. Go to File...Import.

😂 Java - Eclipse SDK	
File Edit Refactor Run Navigate	Search Project Book
New	Alt+Shift+N 🕨 💽
Open File	
Close	Ctrl+W
Close All	Ctrl+Shift+W
[닕] Save	Ctrl+S
Save As	
R Save All	Ctrl+Shift+S
Revert	
Move

Refresh	F5
Convert Line Delimiters To	• •
🚔 Print	Ctrl+P
Switch Workspace	•
Restart	
🚵 Import	
Export	
Properties	Alt+Enter
1 AndroidManifest.xml [Thunderdro	[bio
Exit	

b. From the resulting dialogue box, expand **General** if necessary, and then select **Existing Projects into Workspace**. Hit **Next**.

c. Make sure **Select root directory** is selected, then hit **Browse** and select the unzipped folder that you got from Buzztouch. Just select the root folder...none of the ones beneath it, and none of the files.

Browse For F	older	? 🗙

Working sets:	¥ [Select
2		Cancel
	C Daux Next > Finish	Cancel

e. Wait while Eclipse builds your workspace. You can see the progress in the lower righthand corner of Eclipse.

f. Once the workspace is built, your project should be loaded and ready for you to work with. You should see a screen similar to the following. We'll address the warnings and stuff later...this is just about getting your project into Eclipse.

Method Two: Start A New Android Project.

This method starts an entirely new project, but uses files that you point Eclipse to. It'll say a project already exists in your source folder, but that's OK, just select it, and it'll build the project based on those files.

1. **Start Eclipse**. Start Eclipse by either double-clicking on the icon you set up for it somewhere, or double-clicking on the eclipse.exe file that is found In your installation path. For me, it's at c:\eclipse\eclipse.exe.

2. Start a new Android Project.

1. Go to **File...New...Project**. You might have an option for Android Project, but you might not. So, just select Project.

•	Java -	Eclipse	SDK

	🕀 🚯 Warnings (100 of 187 items)					

Congratulations! Your project is now loaded into Eclipse and ready for you to work with. See...that wasn't so bad!

Before you can actually run your application, you'll need to make sure it's **error free**. It's OK if there are warnings in your application...those are just what they sound like, but you can't have any errors. Take a look at the **Problems** tab and see what's there.

🔝 Problems 🛛 📮 Console 🖾 LogCat 🔜 Progress	
0 errors, 198 warnings, 0 others (Filter matched 100 of 198 items)	
Description 🔺	Resource
🗄 🚯 Warnings (100 of 198 items)	

In this particular example, there are only warnings, so that's a good thing. However...initially, when I loaded this project, it came up with a bunch of errors. I struggled for a bit to understand why, and then

decided to check and make sure the correct Google API was being referenced. It was not, and when I corrected it, all was well. So, if you see errors in you project, do the following:

1. Go to **File....Properties** and click on **Android.** For Buzztouch v1.5 apps, you need to make sure you have selected **Google APIs 2.2/8**. If you have not, none of this will work. Make sure that, and only that, API is checked, and hit **Apply**. Then hit **OK.**

Android 2.2	Android Open Source Project	2.2	8
Google APIs	Google Inc.	2.2	8
Android 2.3.1	Android Open Source Project	2.3.1	9
			-

2. Go to **File...Refresh (F5)** and refresh your project. Hopefully all the errors will disappear! If they don't, something else is wrong, and you'll need to post a message on the forum to ask for help.

Now that your app is error free (remember, warnings are OK), you'r e ready to compile and run it in the simulator. You should have an Android Virtual Device set up in Eclipse per my other document. It will get loaded automatically when you run your app.

To run your app in the virtual device, do the following:

- 1. Highlight your project in Package Explorer
- 2. Go to **Run...Run As...Android Application.** Or, you could hit the green circle icon you see on the toolbar.
- 3. Click on the **Console** tab so you can monitor what's happening. If things are going well, you'll see output that looks like this:

```
[2011-11-30 14:26:28 - buzzTouch] ------
[2011-11-30 14:26:28 - buzzTouch] Android Launch!
[2011-11-30 14:26:28 - buzzTouch] adb is running normally.
[2011-11-30 14:26:28 - buzzTouch] Performing com.thunderdroid.BT_activity_root activity
launch
[2011-11-30 14:26:29 - buzzTouch] Automatic Target Mode: launching new emulator with
compatible AVD 'Buzztouch_v1.5'
[2011-11-30 14:26:29 - buzzTouch] Launching a new emulator with Virtual Device
'Buzztouch_v1.5'
[2011-11-30 14:27:15 - buzzTouch] New emulator found: emulator-5554
[2011-11-30 14:27:15 - buzzTouch] Waiting for HOME ('android.process.acore') to be
launched...
```

- 4. Wait while everything loads...this often takes several minutes. Seriously...you can get a cup of coffee, or perhaps arrange to send me a case of SoBe Fruit Punch (my favorite drink!) while it's loading. The AVD is super slow to load.
- 5. If everything goes well, your app will show up in your AVD, and you'll be doing the happy dance!

(Yeah, I know that's a totally lame looking app, but it was just something I threw together to demonstrate this stuff for you. I'm working on some better stuff...I promise!)

So, now you know that your app works, and after spending countless hours making it look beautiful, you're ready to test it on a real device, or publish it somewhere for the general masses. Let's take a look at how you **Export** your app and create the **.apk** package you need in order to install it on a device.

Depending on whether you are creating a debug (test) package, or a release package, you are going to need to use the Debug Keystore or Release Keystore that I showed you how to create in the previous document. Just a heads up.

Here's the process for creating a **debug package**:

- 1. Highlight your project in Package Explorer.
- 2. Go to File...Export, and select Export Android Application. Expand the Android section if you don't see that option. Hit Next.
- 3. Select the project to export. It should already be filled in with your project name. If not, browse to the folder your project is in. Note the statement "The manifest 'debuggable' attribute is set to true." This is what you want. Hit **Next**.
- Navigate to your debug.keystore file, and enter the keystore password ('android' is the default). Hit Next.

😂 Export	Android Application	
Keystore	selection	0
O Use exis	ting keystore	
O Create r	new keystore	
Location:	C:\Documents and Settings\mf\.android\debug.keystore	Browse
Password:	•••••	
Confirm:		
2		
?	< <u>B</u> ack <u>N</u> ext > <u>Finish</u>	Cancel

5. Choose **Use Existing Key**, and select your debug.keystore alias (default is 'androiddebugkey') and password ('android'). Hit **Next**.

6. Browse to the location you want to have your package saved to, then hit Finish.

7. Check the location to make sure the file was created! If all is good, you can now deploy this on your test device. I've found that putting it on the web somewhere and having a person surf to the package is the easiest way to install.

Creating a **release package** is basically the same process as a debug package. The main differences are the keystore you use, and the fact that the debuggable attribute is set to 'false.' Here's what you do:

 Double-click on the AndroidManifest.xml file in your project tree. You'll find that in Project Explorer. Several tabs should open up, one called Application. In that tab you will find many fields that can be changed, one of which is called Debuggable. You want to set this to false.

d buzzTouch Manifest	🛛 İ strings.xml	project	t.properties 📄 📄 defaul	t.properties	" <u>1</u>		
🚔 Android Mai	nifest Applicatio	n				1	-

Manifest A Applica	tion P Permissions I	Instrumenta	tion F AndroidManifest.xi	ml		>	_

- 2. Highlight your project in Package Explorer.
- 3. Go to **File...Export**, and select **Export Android Application**. Expand the Android section if you don't see that option. Hit **Next**.
- 4. Select the project to export. It should already be filled in with your project name. If not, browse to the folder your project is in. Hit **Next**.
- 5. Navigate to your **release.keystore** file, and enter the keystore password (I have no idea what it would be for you). Hit **Next.**
- 6. Choose Use Existing Key, and select your release.keystore alias and password. Hit Next.
- 7. Browse to the location you want to have your package saved to, then hit Finish.

That's it! Just like with the debug process, you should now have a .apk file somewhere that can be loaded into whatever marketplace you want to distribute from.

Hopefully this document has helped get you on your way to getting a super sweet Android application out to the world. If I'm missing anything, or there are better ways of doing things, please let me know! Constructive criticism is always appreciated!

Comments? Post them in the forum or email me at <u>MrkFleming@gmail.com</u>.
