Common Apple Errors and Solutions

v1.0

By GoNorthWest

11 April 2012

- **Problem:** Couldn't register <appname> with the bootstrap server. Error : unknown error code. This generally means that another instance of this process was already running, or is hung in the debugger.

    o Restart Xcode, Mac, device, or all

    o http://stackoverflow.com/questions/3375442/bootstrap-server

- **Problem:** Submitting an application to iTunes, and you receive "Please make sure that you have set up a record for this application on iTunes connect."

    o Go into iTunes Connect, and ensure that your application is set to "Ready to Upload Binary." This occurs after you move from "Prepare to Upload" and answer a few questions.

- **Problem:** warning: iPhone apps should include an armv6 architecture (current ARCHS = "armv7"). iPhone/iPod Touch: application executable is missing a required architecture. At least one of the following architecture(s) must be present: armv6 (-19033)

    o Add the missing architecture to your project

    o http://stackoverflow.com/questions/4198676/warning-iphone-apps-should-include-an-armv6-architecture-even-with-build-config

- **Problem:** Archived application not showing up in Organizer.

    o This is a two step process in building your application and having it moved to Organizer for upload to iTunes Connect:

        1. Product…Build For…Build for Archive

        2. Product…Archive

    o The second step is the one that sends your archive to Organizer.

- **Problem:** After archiving, you receive the following error – "iPhone/iPod Touch: Icon.png: icon dimensions (0 x 0) don't meet the size requirements. The icon file must be 57x57 pixels, in .png format (-19014)"

  - According to @Aescleah, this is a problem related to OS X Lion (10.7.3) and can be corrected by doing the following:

    1. Download and install Application Loader from iTunes Connect

    2. Quit/Restart Xcode

    3. Do a Product…Clean, then Product…Build For…Build For Archive
